THE COMMUNITY OUTREACH DEPARTMENT ANNUAL REPORT

Basic Safety of Computer Troubleshooting

MicroSociety, the Computer Engineering Society, held its first community outreach program, “Basic Safety of Computer Troubleshooting: Hands-on Workshop,” last March 15, 2024 (Friday). The day buzzed with activity as several Computer Engineering Students from the University of Perpetual Help System Laguna – Biñan Campus took center stage. As such, the young instructors were divided into two groups, each tackling a crucial aspect of computer literacy.

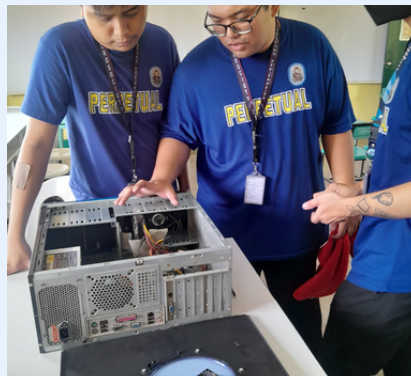

The first group, comprised of students well-versed in computer maintenance, including Mr. Ian Aspera and Ms. Nancy Mercado from the College of Engineering, Architecture and Aviation faculty, presented a workshop for the school’s staff and teachers. Focusing on “Safety First,” they equipped the adults with essential knowledge regarding proper handling of computer components and troubleshooting techniques.

They emphasized “do’s and don’ts,” ensuring participants understood safe practices to avoid damaging equipment or losing valuable data. The staff and teachers actively participated, asking insightful questions and soaking up the valuable information presented by Sir Ian Aspera, as well as a few of the Computer Engineering students present in the room.

Meanwhile, the second group of student-teachers for the day captivated the attention of younger students with an engaging topic around the world of computers which is tailored specifically for children, the session explored the basics of computer functions. Through interactive activities and easy-to-understand explanations, they demonstrated how computers are used in everyday life, from learning and entertainment to communication and even creative pursuits.

By the end of the program, it was clear that the knowledge exchange had been a two-way street. The student-instructors gained valuable experience in public speaking and knowledge in dissemination, while the staff, teachers, and schoolchildren all emerged with a deeper understanding of computers and their safe handling.
